**Navigating PFAS Chemistry in complicated samples:  
Analysis in the Modern Laboratory and Future Aspects**

*By* Alexandros G. Asimakopoulos (PhD),  
Professor

## • How did it all start?

-**1938**: The chemistry for PFAS (Per- and polyfluoroalkyl substances) was initially discovered by Roy J Plunkett at Dupont's Jackson Laboratory in Deepwater, New Jersey.

-**1945**: DuPont commercialized PTFE as Teflon

-PTFE was resistant to corrosion, had low surface friction, and high heat resistance.

-TFE can cyclize **with a wide variety of compounds which led to the creation of a range of organofluorine compounds.**

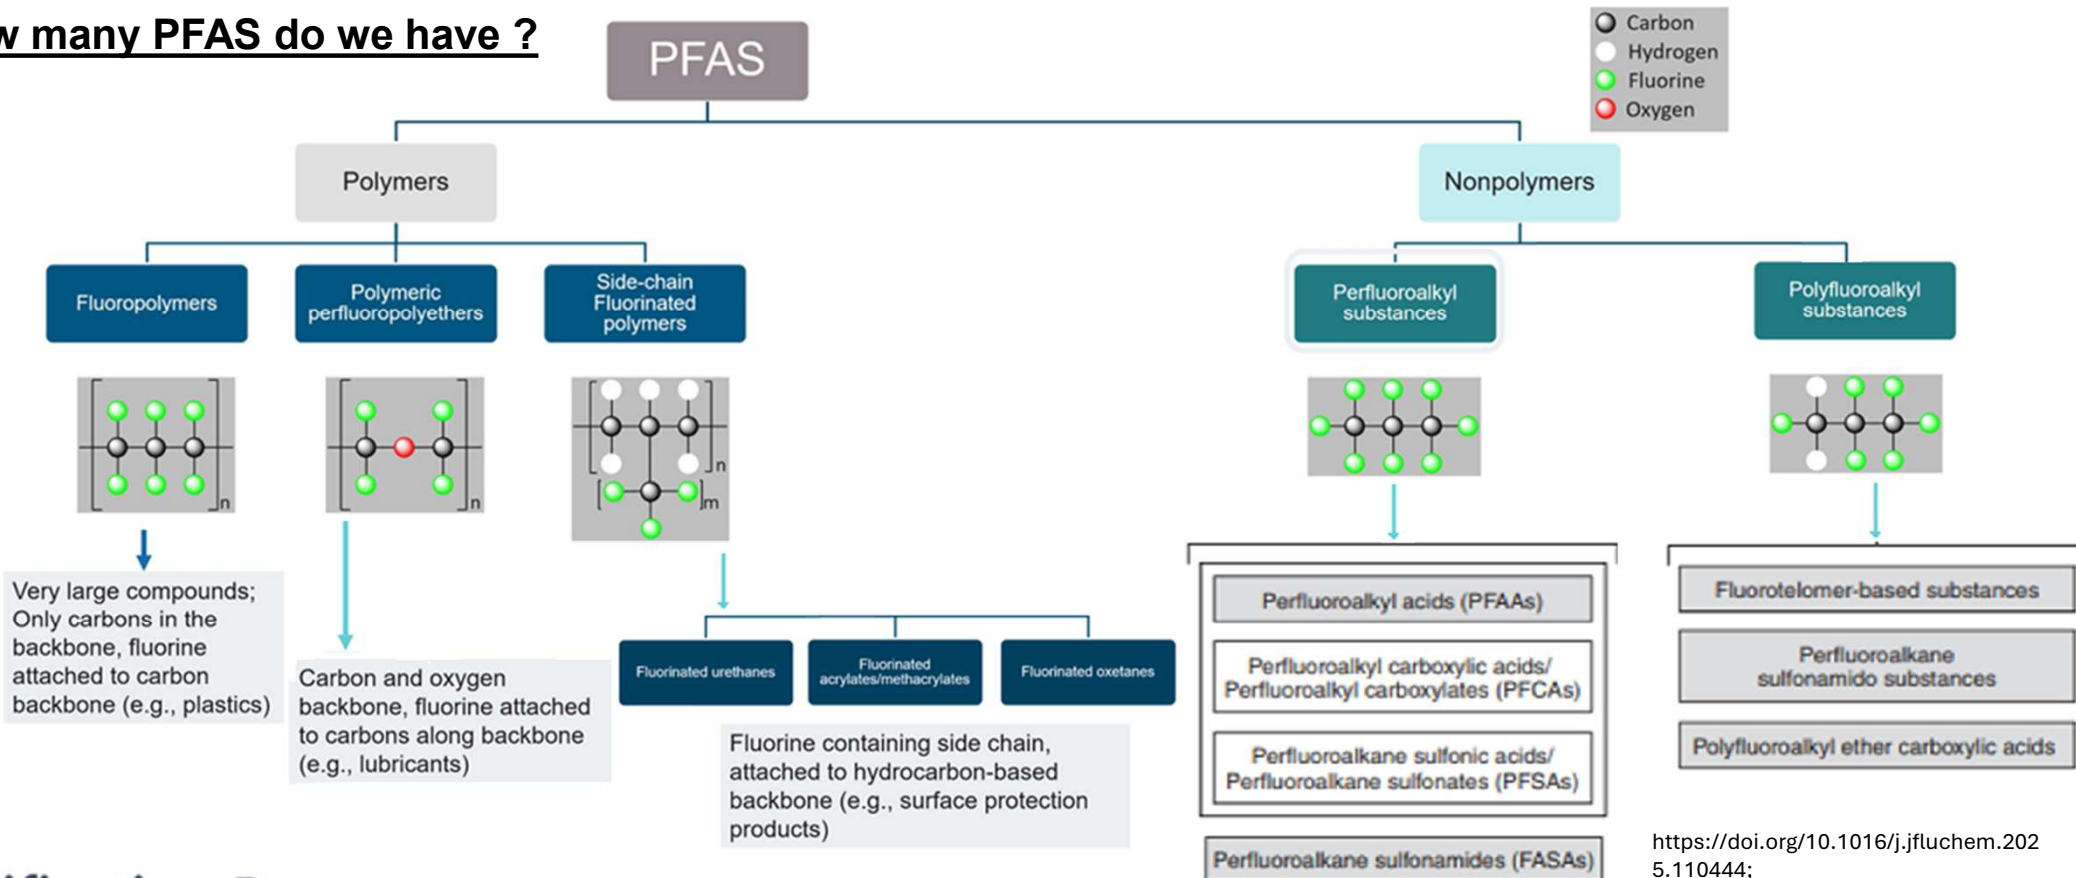

-**1950s**: First large-scale release of waste by 3M is documented in Lake Elmo, Minnesota, USA

-**1954**: DuPont, received an inquiry about **C8** (PFOA) "possible toxicity."

-**1961**: PFOA low dose exposure was linked to the enlargement of rats' testes, adrenal glands, and kidneys.

So the first attempts for measuring **fluorinated organic compounds/classes**  
**can be documented back to the late 1940s.**

# How many PFAS do we have ?

## Classification Browser

### Classification Description (from PubChem)

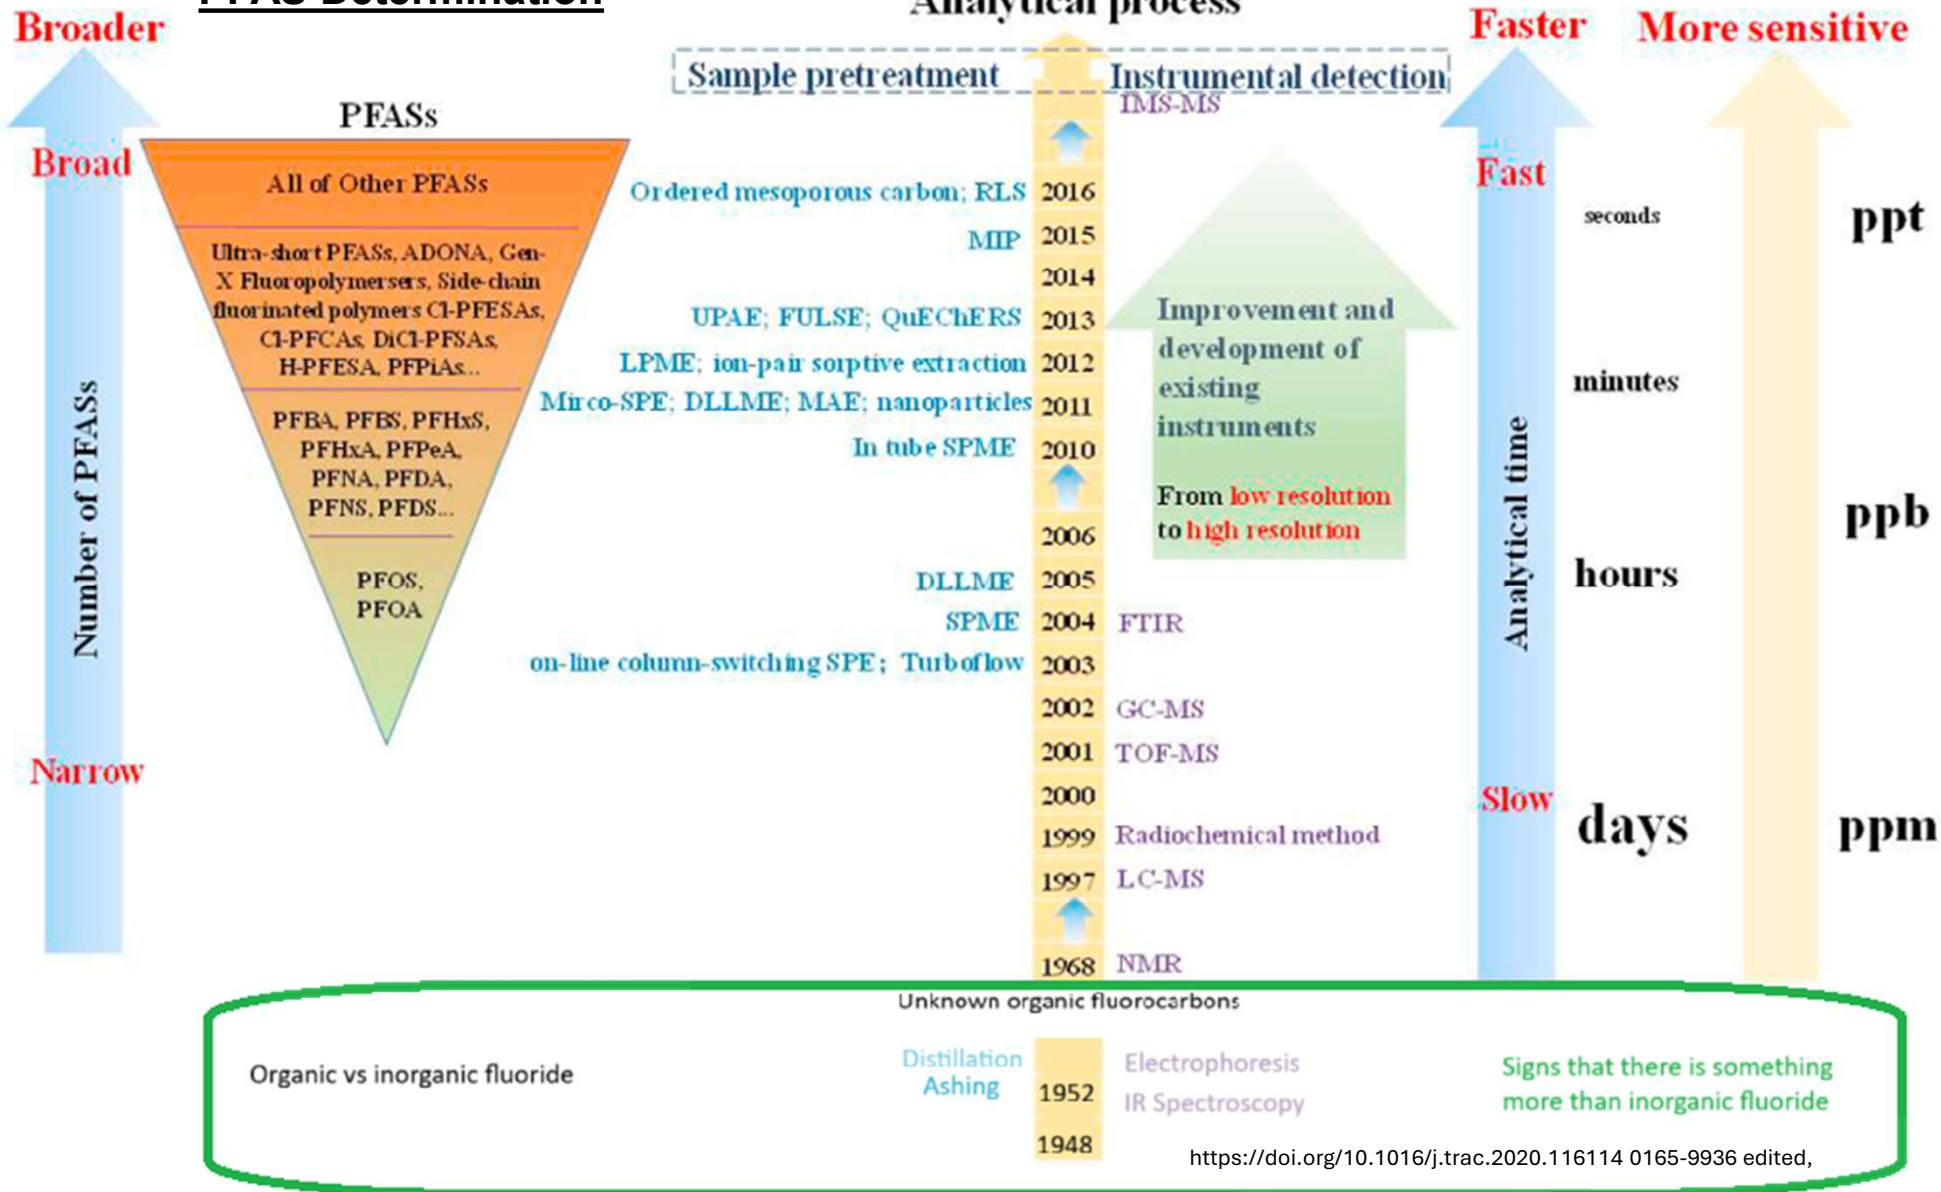

The collection of per- and polyfluoroalkyl substances (PFAS) and other fluorinated compounds in PubChem as described in <https://doi.org/10.1021/acs.est.3c04855>. The 'OECD PFAS definition' (no salts) and 'PFAS breakdowns by chemistry' (with salts/mixtures) nodes contain PubChem content matching the OECD PFAS definition of saturated CF<sub>2</sub> (Report ENV/CBC/MONO(2021)25). Other nodes explore 'organofluorine compounds'; 'other diverse fluorinated compounds'; 'PFAS and fluorinated compound collections' (including CompTox; NORMAN-SLE; NIST; OntoChem PFAS lists) and 'regulatory PFAS collections' (including Stockholm Convention/EU regulations for PFOS; PFOA; PFHxS; LC-PFCAs). Expand each node for more detailed content. Read more about this tree here: [https://gitlab.com/uniluxembourg/lcsb/eci/pubchem-docs/-/raw/main/pfas-tree/PFAS\\_Tree.pdf?inline=false](https://gitlab.com/uniluxembourg/lcsb/eci/pubchem-docs/-/raw/main/pfas-tree/PFAS_Tree.pdf?inline=false)

PFAS and Fluorinated Compounds in PubChem 23,165,505

OECD PFAS definition 7,193,873

• Organic Fluorocompounds vs. Inorganic fluorine

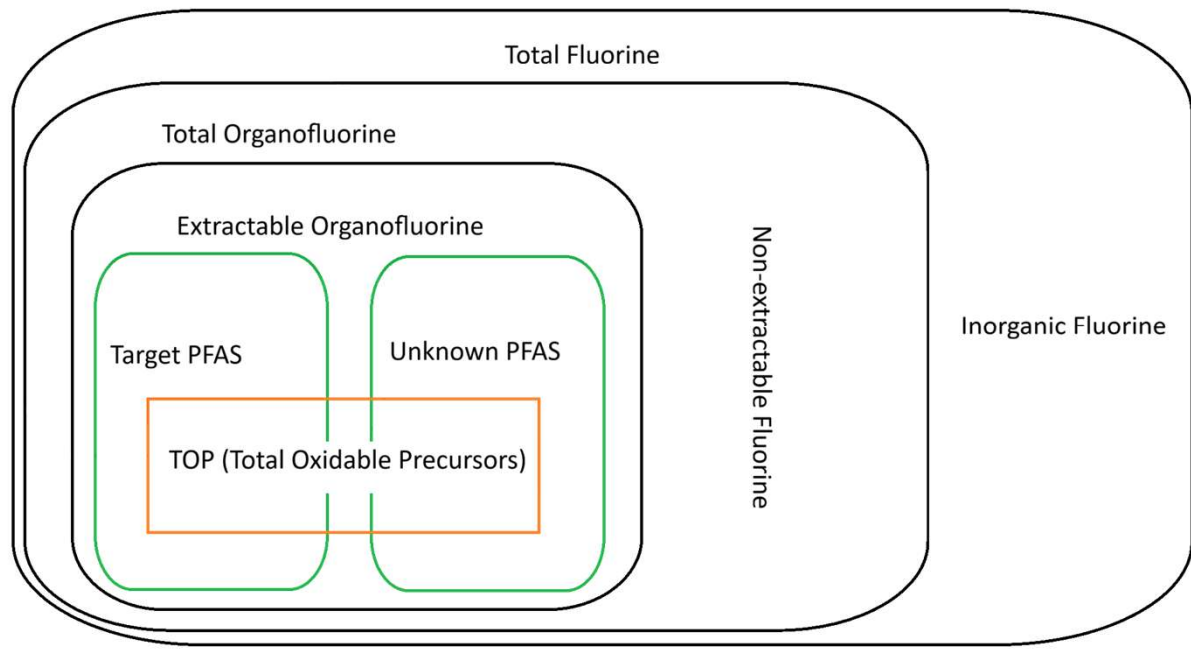

1. Taves, D.R., Nature (1966), 211, 192.  
 2. Taves, D.R., Nature (1968), 217, 1050.  
 3. Taves, D.R., Nature (1968), 200, 582.  
 4. Taves, D.R., Talanta (1968), 15, 1015.

- Discovered that samples of his own blood serum contained two distinct forms of fluoride.
- Only one of these was exchangeable with radioactive fluoride. The other, non-exchangeable form was detectable as fluoride only when sample preparation included ashing.

The inorganic fluorine was exchangeable with radioactive fluoride.

The organic fluorine was detectable as fluoride only when sample preparation included ashing!

Little has been published about the metabolic handling and toxicology of perfluorinated fatty acid derivatives. Computer assisted literature searches using Medline, Toxline and Chemcon developed no information on these subjects. This was surprising with respect to the widespread commercial use of such compounds. It would appear from information presented here that rapid excretion of such compounds into urine is unlikely since they are bound to albumin in the blood.

These findings suggest that there is widespread contamination of human tissues with trace amounts of organic fluorocompounds derived from commercial products. All available information on this subject is in accordance with this interpretation. A series of compounds having a structure consistent with that found here for the predominant form of organic fluorine in human plasma is widely used commercially for their potent surfactant properties.

## Navigating common sample preparation pitfalls

**AVOID**

Teflon™ or other materials containing fluoropolymers

low-density polyethylene (LDPE) and glass bottles, Teflon™-lined caps, chemical ice packs (i.e. Blue ice®)

clothes and shoes made of Gore-Tex® or other synthetic water- and stain-resistant materials, Tyvek materials, fabric softeners

cosmetics, moisturizers, hand creams, sunscreen, insect repellents

**USE**

high-density polyethylene (HDPE), polyetheretherketone (PEEK), polypropylene (PP) silicone material

HDPE or PP containers and screw caps, regular ice, Zip-lock bags

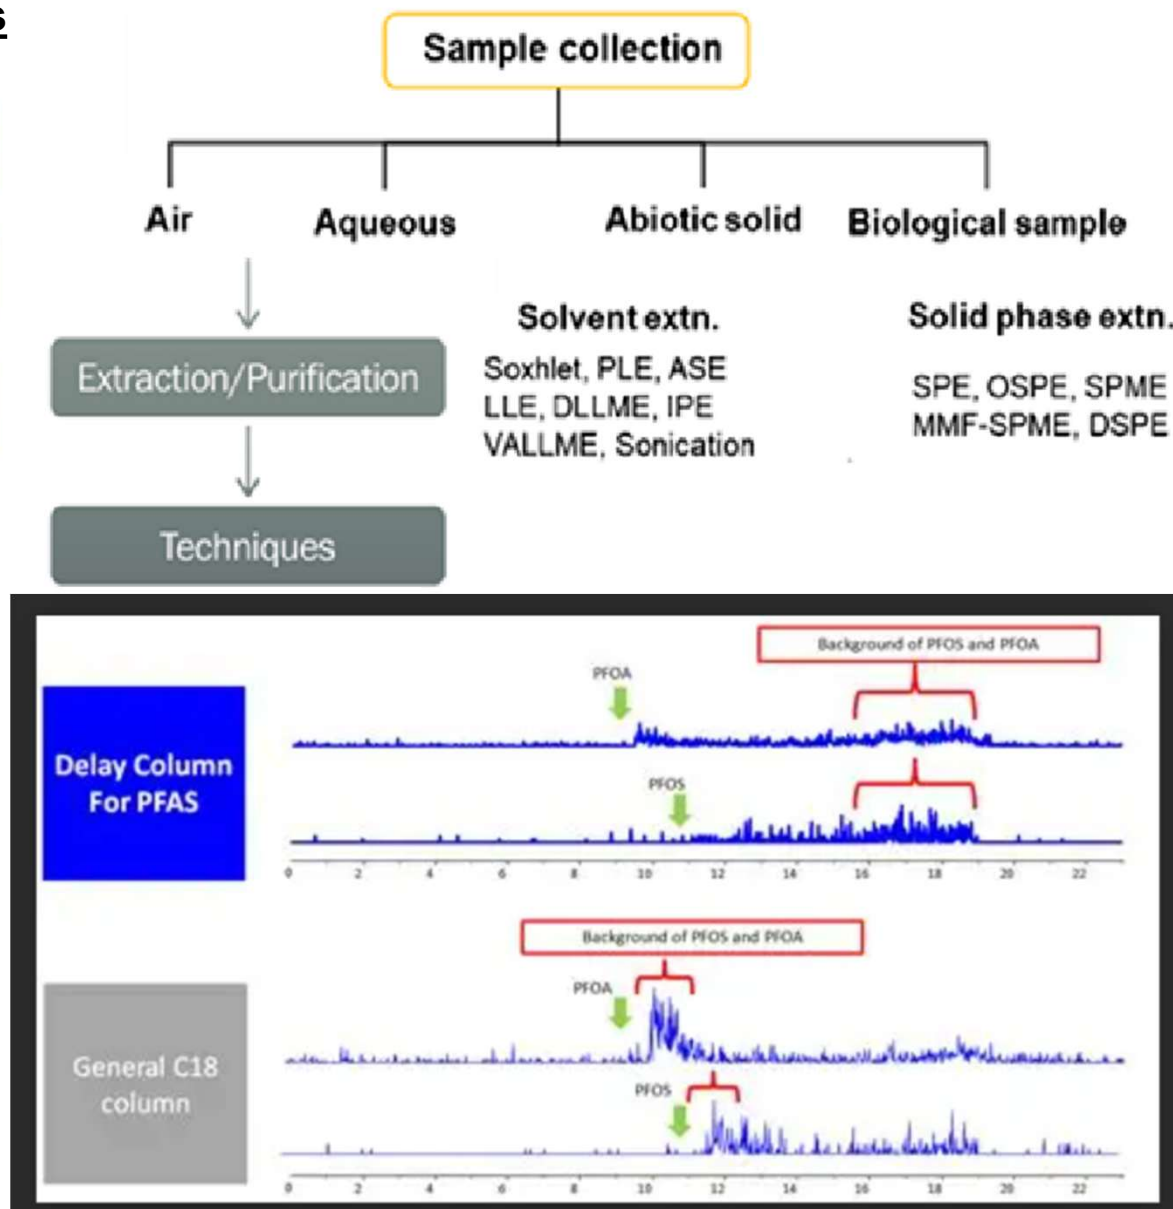

cotton, polyurethane, wax-coated clothing; PVC or polyurethane shoes

### Background Control

- Install delay column between pump and injection in LC instrument
- Use alternative blank matrices, such as FBS devoid of target PFAS, for preparing calibration and QC samples
- Evaluate and monitor potential background contamination

DELAY COLUMN EXPLANATION; <https://doi.org/10.1007/s00216-022-03905-y>;  
<https://doi.org/10.1016/j.trac.2023.117062>

## • Tackling Background concentrations

- If instrumental background levels were found, they were eliminated before analyses by injecting sufficient blanks to cleanse the system (8 to 10 blanks were required).
- Additionally, to minimize build-up of PFCs during mobile phase equilibration and to keep background levels constant, the time duration for which the system was kept under initial conditions was maintained as short as possible.
- Prior to daily use, we flushed the LC column with elution solvents [MeOH/5 mM ammonium formate (70 : 30, % v/v)] before initiating a sequence.

<sup>c</sup> Department of Water Resources, Faculty of Civil Engineering, National Technical University of Athens, Zografou, Athens 15773, Greece

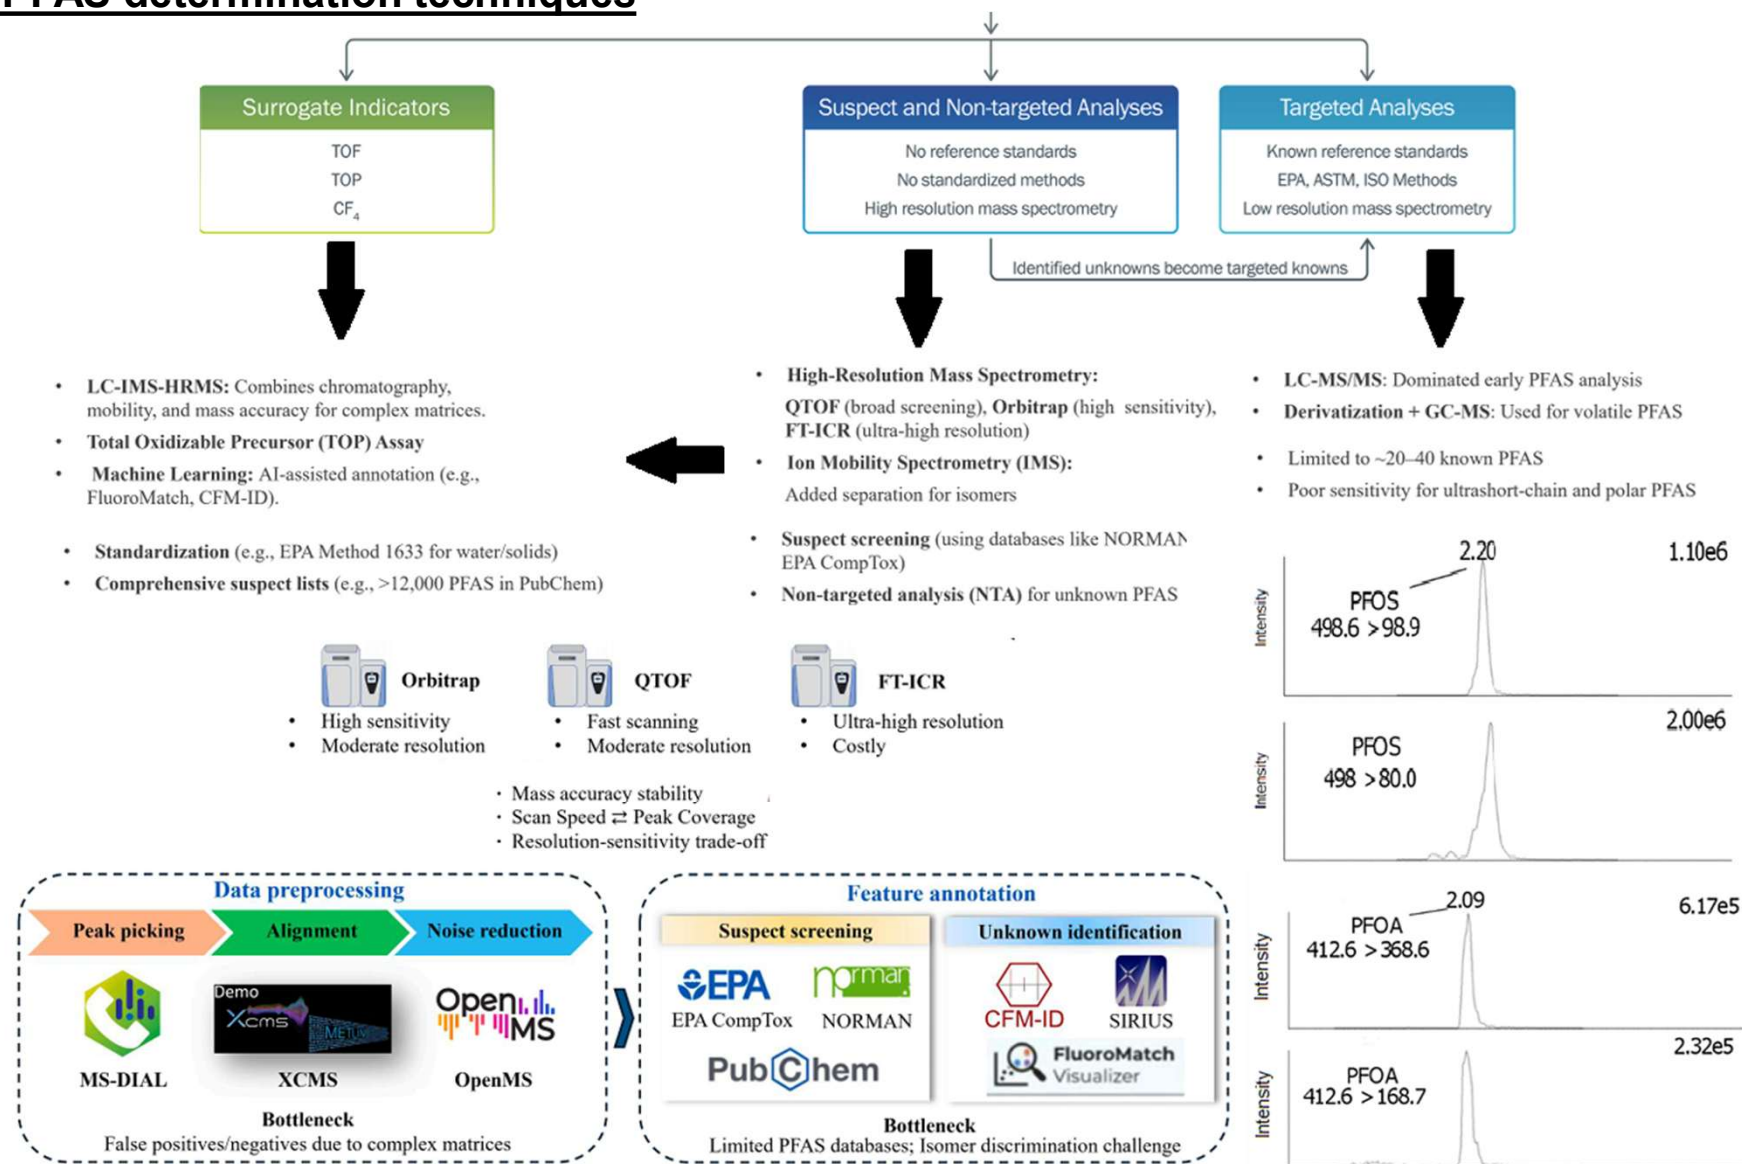

#### HIGHLIGHTS

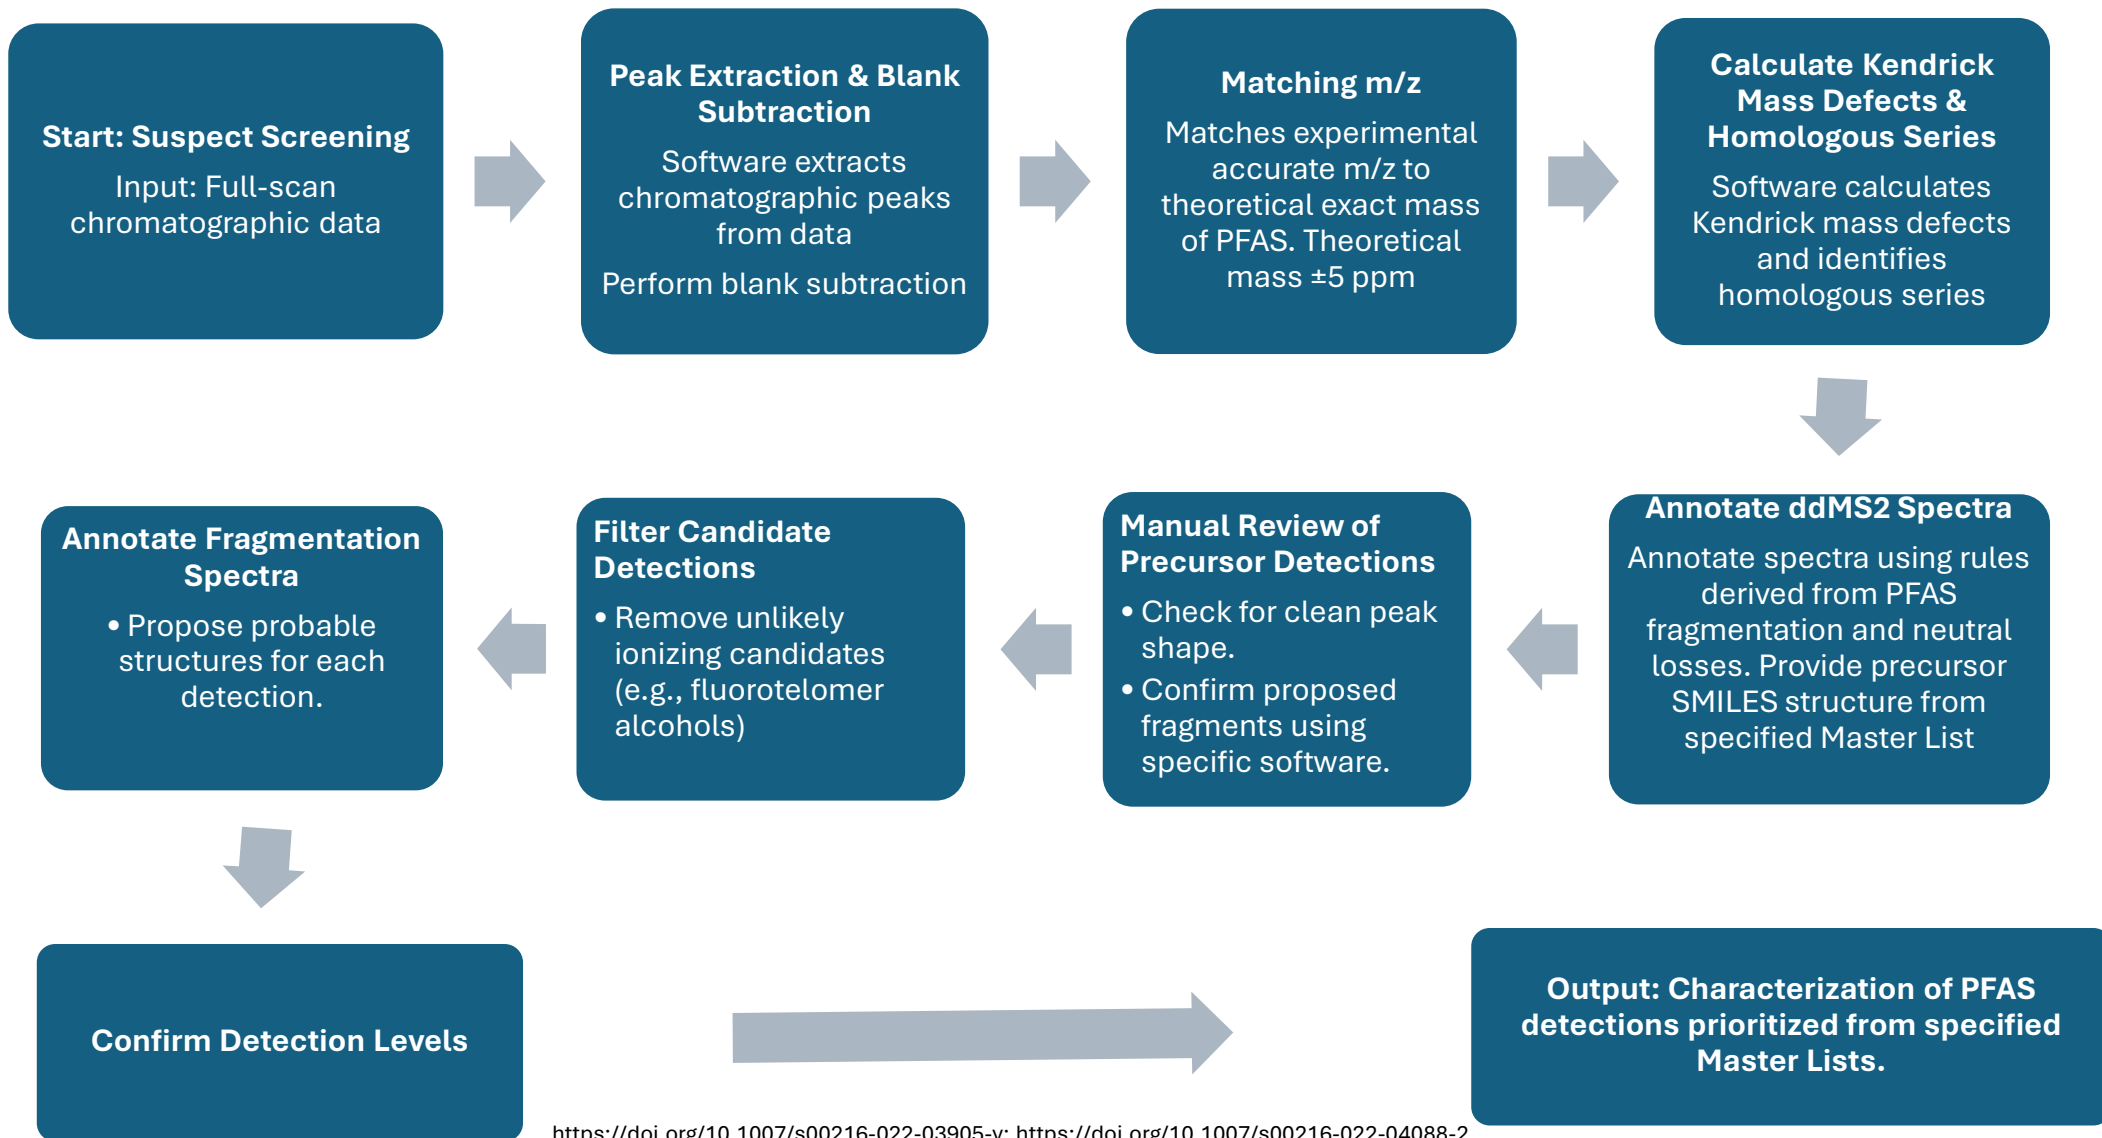

- Solid-liquid distribution coefficients were calculated for various micropollutants.
- The highest concentrations were detected for TTR in raw sewage and for NP in sludge.
- Removal during wastewater treatment was >70% only for 9 over 27 detected compounds.
- 60% of BTRs and 28-75% of BTHs was removed due to biotic processes in bioreactors.
- Sorption to primary sludge was a significant mechanism for the removal of EDCs.

### HIGHLIGHTS

- Unknown per- and polyfluoroalkyl substances were found in biota samples.
- Perfluorosulfonic acids were produced in all samples after TOP assay.
- Shorebird serum shows higher levels of perfluorocarboxylic acids than red blood cell.
- Shorebird liver shows the highest levels of perfluoroalkyl acids after TOP assay.

## Tailoring TOP Assay for Enhanced Applicability

Comparison of the mean PFAS product yields from (a) extract-based oxidation (eTOP) versus (b) direct oxidation on sediment (dTOP), based on dry weight (DW). Solid bars represent PFCAs; striped bars represent PFSA.

Medians of total PFAA (a), PFCA (b), and PFSA (c) and median of TOC-normalised total PFAA (e), PFCA (f), and PFSA (g) concentrations before and after dTOP assay (pre-dTOP & post-dTOP) in sediment samples from mining, municipal and e-waste, and agricultural regions in Ghana, as well as a background site in Keta Lagoon.

Thank you all for your attention!
